

EVIDENCE FOR IDT IN WOUND MANAGEMENT

Snyder Robert J.¹

¹*Barry University (Miami, United States).*

Research supports the premise that a multidisciplinary approach to wound management is both effective and cost efficient. However challenges exist in formulating these groups including ensuring continuum of care, prevention of departmentalizing physician services, and lack of certain essential skill sets in a particular community, among others. This presentation will give an overview of the evidence for the inter-multidisciplinary team approach and the unique challenges and controversies clinicians and hospitals may face.
